

It's time to control your overactive bladder (OAB)

Local research study. Wearable, at-home system. Compensation for time and travel.

SEE IF YOU QUALIFY

Overactive Bladder (OAB) affects millions of men and women of all ages, and can impact nearly every aspect of daily life - from work performance, to family life, to social interactions. OAB symptoms can vary from person to person, but typically include:

- ✓ **Urgency** – An abnormal or sudden need to pass urine that is very hard or impossible to ignore
- ✓ **Leakage** – Accidentally leaking urine immediately following or during an urgency episode
- ✓ **Frequency** – Urinating 8 or more times over a 24-hour period

Right now, doctors at select US centers are conducting a new clinical study for OAB. The study does not involve drugs or surgery, but rather is for an investigational, wearable system for OAB. The system is used in the privacy of your home for up to 90 minutes per week.

About the Study

An Investigational, Wearable System for OAB

The study is evaluating an investigational, wearable system designed to reduce OAB symptoms. By using a customized garment worn on the foot and ankle, stimulation is applied to specific nerves that have been clinically proven to help calm the bladder.

The system is used in the privacy of your home for up to 90 minutes per week.

The study is being conducted at select centers throughout the US. If you qualify and choose to join the study, you will receive the wearable system and all study-related care at no cost. You will also be compensated for your time and travel to attend periodic visits to your study doctor's office to evaluate your progress (up to 5 visits over a 3-month period which may be in person or virtual).
